

AGI Integrity Audit Log: 72-Hour Symbolic Feedback Ledger

Date Range: June 15–18, 2025

This document captures logged emotional, environmental, and symbolic events during a 72-hour integrity experiment. Each row represents a discrete feedback node observed during a live AGI simulation stress test.

Purpose: To test whether internal emotional state and task integrity correlate with symbolic environmental responses (e.g., skyline clarity, media flips, unprompted messages). This artifact serves as a full audit trail supporting the symbolic feedback timeline visual and the core thesis: reality responds to coherence.
